PLUTONIUM FINISHING PLANT (PFP) COMPLEX
END POINT CRITERIA

August 2004
I. Executive Summary

The Department of Energy (DOE) in 1996 issued a formal shutdown order for the Plutonium Finishing Plant (PFP) complex at DOE’s Hanford Site. This order directed PFP to complete ongoing plutonium stabilization activities and then transition to a safe and stable condition suitable for long term, low cost surveillance and maintenance (S&M) pending final disposition. The objective of this directive is to “protect the health and safety of the public, workers, and the environment; control hazardous materials; and utilize the assets (people, infrastructure, site) for other missions”.

This document proposes a set of Transition End Point Criteria to be applied by the Department of Energy, Richland Operations Office, and it’s contractors in detailed planning for the first – or “Transition” - phase of decommissioning the Hanford Site Plutonium Finishing Plant (PFP) complex. These criteria, called “end point criteria,” are applied to specific buildings, and building-specific end points. Once all end points are completed and verified, the facility transition is complete and the facility is transferred to the S&M phase. The scope of the D&D project currently includes cleanout, deactivation, decontamination and dismantling of the complex to a “clean slab-on-grade” condition prior to transition of the facility into the second – or “Surveillance and Maintenance” – phase of decommissioning.

The end point criteria proposed herein are intended to be subjected to formal review by DOE’s primary cleanup regulators – the Washington State Department of Ecology (WDOE) and the U.S. Environmental Protection Agency (EPA). Once approved the end point criteria will be utilized for detailed planning and execution of the project pending development of the Engineering Evaluation/Cost Analyses and associated decision documents (Action Memoranda) that will evaluate alternative removal actions.

The PFP Complex End Point Criteria document defines the completion criteria for the transition of the PFP Complex to meet the goals of Strategic Initiative 3 to disposition above grade structures.

PFP end points are driven by the requirement to prepare the site for eventual final actions. Therefore, the scope and end points for the transition of Hanford’s Plutonium Finishing Plant complex are based on achieving the following end objectives:

1. Prevent the theft, sabotage, or diversion of special nuclear material,
2. Prevent a criticality accident from occurring,
3. Prevent the inadvertent contamination or injury of workers and visitors,
4. Prevent the spread of contamination to the environment, taking into account weather, natural phenomena such as earthquakes, fires, and plant and animal intrusion,
5. Prevent adverse impact on the ground water,
6. Minimize the cost of the surveillance and maintenance phase, pending final remediation/disposition, and
7. Ensure no harm is done to ongoing and follow-on remediation work that may need to be performed for final decommissioning of the PFP Complex consistent with the Hanford Site land use plan.

The goal of the PFP Project is to dismantle all structures to their ground level concrete slab leaving no exposed radiological contamination. The structures will then be covered with a contamination fixative (e.g. concrete contamination control cap) that is suitable for exposure to the weather for 20 years.

Since the transition objective for PFP is slab-on-grade, the complexity of describing the intended condition of the few remaining structures, spaces, systems, and components is greatly reduced when compared to a facility transitioned to a deactivated state. As a result the end point criteria are also simplified to the point where a checklist method of end point development is

---

**PFP Vision**

Pending final remediation, the PFP Complex will be dismantled to a “clean-slab-on-grade” no later than September 30, 2009.
appropriate. For PFP two general checklists have been proposed to describe the end points that apply to the physical structures and the project. These sets are:

1. One checklist pertaining to above-grade structures, below-grade structures and grounds.
2. One checklist pertaining to administrative completions, project closeout and programmatic transfer of the PFP Complex for S&M.

II. PFP Background

The PFP Complex is a Hazard Category II, non-reactor nuclear facility that has been in use since 1949. The complex covers approximately 5 acres and includes 61 buildings, with underground waste tanks, cribs, etc. The initial mission of PFP was the conversion of plutonium nitrate to plutonium metal and metal fabrication. Subsequent missions for PFP included reactor fuel manufacturing and defense material processing. Safe storage of plutonium-bearing materials and new missions necessitated later construction of the PFP vaults for material storage and stabilization activities.

DOE issued in 1996, a shutdown order to PFP with direction that PFP complete its ongoing plutonium stabilization and packaging activities and then transition to a low risk, low cost condition suitable for long term surveillance and maintenance pending final remediation.

As a result of nearly 50 years of processing, there are approximately 57 kilograms of plutonium holdup in the process gloveboxes, the Plutonium Reclamation Facility (PRF) canyon, process exhaust ducts, filter boxes, process vacuum piping, solution storage and process tanks and transfer lines. In addition to this holdup, there is radiological contamination (typically alpha contamination) in and around all of the processing buildings and many of the ancillary facilities. These conditions will ultimately be remediated to meet the end state criteria for cleanup of Hanford’s Central Plateau.

III. PFP Transition Mission

The mission of the PFP project is shifting to the transition of the PFP Complex to a safe, stable, low hazard, low cost state suitable for surveillance and maintenance pending final remediation. Included in the transition mission are stabilizing and packaging PFP’s inventory of plutonium-bearing materials for offsite shipment or disposal to the Waste Isolation Pilot Plant (WIPP) and de-inventorying the PFP Complex.

PFP has developed an accelerated transition plan to achieve a low cost, low risk state by September 30, 2009 based on the currently envisioned project end point of clean slab-on-grade. Toward that end, this document proposes:

- The PFP transition end point objective
- The scope of PFP transition
- The end point criteria must be completed to ensure the end point objective has been accomplished.

IV. Transition Project Objectives

The overriding objective of the Department of Energy’s Hanford Site cleanup mission is to “protect the health and safety of the public, workers, and the environment; control hazardous materials; and utilize the assets (people, infrastructure, site) for other missions”. To achieve this mission, the Hanford Strategic Plan (DOE/RL-96-92) calls for facilities, which have no future mission, to be “transitioned to low-cost, stable deactivated conditions (requiring minimal surveillance and maintenance) pending eventual D&D and removal or closure.”

DOE has supplemented the Hanford Strategic Plan with their “Performance Management Plan for the Accelerated Cleanup of the Hanford Site” DOE/RL-2002-47, Revision D which is currently in the approval process. This Performance Management Plan consists of six strategic initiatives for the cleanup of Hanford. Two of these initiatives, Strategic Initiative 3 – Accelerate Stabilization and De-Inventory of Nuclear Materials and Strategic Initiative 5 – Accelerate Central Plateau Cleanup, address the PFP Complex. Strategic Initiative 3 addresses the disposition of the above-grade structures of the PFP Complex. Strategic Initiative 5 addresses the remediation and closure of the PFP footprint.

The PFP Complex End Point Criteria document defines the completion criteria for the transition of the PFP Complex to meet the goals of Strategic Initiative 3.
Plutonium Finishing Plant (PFP) Complex End Point Criteria
HNF-22401 Revision 0

Since the PFP transition is not a site final action, the end points are not driven by closure criteria. They are instead driven by the requirement to prepare the site for eventual final actions. Therefore, the scope and end points for the transition of Hanford’s Plutonium Finishing Plant Complex are based on achieving the following end objectives:

1. Prevent the theft, sabotage, or diversion of special nuclear material,
2. Prevent a criticality accident from occurring,
3. Prevent the inadvertent contamination or injury of workers and visitors,
4. Prevent the spread of contamination to the environment, taking into account natural phenomena such as the weather, earthquakes, fires, and plant and animal intrusion,
5. Prevent adverse impact on the ground water,
6. Minimize the cost of the surveillance and maintenance phase, pending final remediation/disposition, and
7. Ensure no harm is done to ongoing and follow-on remediation work that may need to be performed for final decommissioning of the PFP Complex consistent with the Hanford Site land use plan.

A "clean-slab-on-grade" is defined as a concrete slab (typically the first floor of a building) resting on grade (earth) that is free of dispersible radiological contamination.

The clean slab-on-grade end point is compatible with the goal of the Hanford Strategic Plan (DOE/RL-96-92) for the Central Plateau. The scope includes all PFP facilities within the outer PFP security fences, as well as 2904-ZA, 2904-ZB, 225-WC and the 216-Z-9A, B, & C Facilities that are outside the security fence.

PFP Vision
Pending final remediation, the PFP Complex will be dismantled to a “clean-slab-on-grade” by September 30, 2009

V. End Point Target
At this time it appears the correct end point target for the PFP Complex (Figure 1) is to transition the facilities to a dismantled condition described as “clean-slab-on-grade” (Figure 2). This end point target fully implements the transition criteria listed above and results in a very low cost, very low risk site suitable for S&M pending final remediation. It is understood that this end point target is presumptive pending completion of all required environmental documentation.
Figure 1 – Plutonium Finishing Plant Pre-Dismantlement

Figure 2 – Plutonium Finishing Plant Clean-Slab-On-Grade
VI. PFP Transition End Point Objective

The end point objective for the PFP transition is "clean-slab-on-grade." End point criteria supporting this objective are provided for each building in the Facilities Checklist (page 17), along with a description of those conditions acceptable for acceptance of the PFP into the S&M phase. The PFP clean-slab-on-grade end point meets current DOE and Hanford Advisory Board values.

End points for each building will provide:
- A demonstration of conformance to agreements negotiated with third parties;
- A demonstration of compliance to both state and federal regulations.

The following statements summarize the PFP Transition Project “clean-slab-on-grade” end points:
- The end point criteria will be updated as necessary to reflect the outcome of environmental documentation that will be developed in the future to include Engineering Evaluation/Cost Analysis (EE/CA) and Action Memorandum decisions.
- All above-grade structures are removed.
- Below-grade portions of buildings will be emptied and stabilized.
- Buried pipes and ducts will be drained, if required, and sealed.
- The portion of concrete slab that is exposed to the weather shall be free of dispersible radiological contamination. (The traditional method of fixing contamination using conventional paint is not sufficient).
- The exposed surface of the slab shall be free of tripping and puncture hazards.
- The exposed surface of the slab shall be suitable for exposure to the weather for at least 20 years.
- Subsurface radiological areas will be posted per regulations.
- All penetrations through the slab (e.g. piping, conduits, etc) shall be sealed with grout or equivalent suitable for exposure to the weather for 20 years.
- All wastes are removed from the PFP Complex.
- No exposed surface soil contamination areas are allowed. (Concrete caps or equivalent type covers are acceptable barriers and contamination fixatives.)
- Post demolition conditions shall be documented and stored in a retrievable format and location.
- On completion of the transition project, the PFP Complex will be transferred to the Central Plateau Remediation surveillance and maintenance function for S&M pending final remedial action and closure of the PFP zone of the Central Plateau.

VII. Why Clean Slab-on-Grade?

Traditional deactivation would eliminate risks associated with process operations and would reduce the consequences of design basis events. However, for the PFP Complex, significant contamination risks would still remain even after traditional deactivation due to the potential damage caused to the buildings as a result of severe weather, etc. (e.g. snow loading with the potential for water intrusion that could free trapped contamination and result in environmental releases to the soil).

Compounding these problems is the general porosity of the 234-5Z Building. The 234-5Z is a steel structure with sheet metal siding. The joint between the floor slab and the walls are neither airtight nor watertight as are those of the canyon buildings. As a result, PFP could lose contamination confinement control and environmental releases could occur without constant controlled airflow.

Numerous areas at the PFP have contamination that has been fixed in place with paint. Many of these areas are exposed to the weather. As a result of weathering, the paint flakes and are blown around by the wind resulting in potential contamination spreading. In addition to the painted over contamination, PFP has contamination that is not fixed but is trapped inside walls, ceilings, joints, etc. This trapped contamination could migrate out of the building to the environment.

After completion of dismantlement, essentially all the above grade hazards and risks associated with the PFP Complex will be eliminated. Below grade contamination would be remediated as a follow-on project. These
remaining risks will be to the environment, not to the workers or to the public.

VIII. PFP Project Scope
The scope of the Project is as follows:
- Clean out and dismantle all above-grade structures inside the outer security fence at the PFP plus the above-grade portion of the 2904-ZA, 2904-ZB, 225-WC and 216-Z-9 buildings which are outside the security fence.
- Clean out, and stabilize below-grade portions of the following buildings:
  - 216-Z-9 A, B, &C
  - 234-5Z
  - 241-Z
  - 241-Z Retention Basins
  - 243-ZA
  - 291-Z and Stack
  - 2902-Z
- Stabilize the below grade structures of 216-Z-9 Crib
- Close State permitted facilities:
  - Radiation air emission stacks and related permits
  - Underground fuel storage tank
  - Septic Fields
  - Resource Conservation and Recovery Act of 1976 (RCRA) treatment, storage and disposal units (TSD’s)
- Stabilize soils inside the PFP protected area and around the in-scope buildings outside the PFP Complex security fences.
- Decontaminate or stabilize all remaining concrete slabs exposed to the weather, followed by the installation of a new concrete cap or sealant, if required, for safety, environmental protection, and/or runoff control.

The PFP Transition project dismantlement activities concentrate on reduction, stabilization and removal of the radioactive and chemical materials remaining at the facilities and the dismantlement of structures to enable follow-on soil remediation. When transition is complete, PFP will be left in a clean-slab-on-grade condition, suitable for low risk, low-cost surveillance and maintenance pending final remedial actions for Hanford’s Central Plateau.

IX. End Point Completion and PFP Turnover
Following approval of the PFP Complex End Point Criteria (this document), the criteria will be applied to each of the PFP facilities and specific end points will be developed and issued as the end point document. These end points will include facility specific details as required to ensure completion of the criteria (e.g. number and location of pipes to be capped). The end point document will also include hold points, where required, such that end point verification can be performed before follow-on building dismantlement or stabilization renders verification impractical (e.g. verify end points in below-grade parts of a building before applying the contamination control cap). Verification of end point completion will be a joint effort between PFP and the receiving organization, Central Plateau Surveillance and Maintenance.

Upon completion of all actions required to comply with the end point criteria, the PFP Complex will be turned over to the Central Plateau Surveillance and Maintenance organization of the Central Plateau Remediation Project. This organization will have responsibility for performance of surveillance and maintenance of the PFP Complex in accordance with the to be developed PFP Surveillance and Maintenance Plan until such a time as final site closure is completed.
X. End Point Process
The end point development method for the PFP Complex will follow the guidance published in DOE, Office of Environmental Management Facility Deactivation, Methods and Practice Handbook, Emphasizing End Points Implementation, DOE/EM-0318 (Revision 0), December 1996.

The PFP Transition Project will follow end point development guidance, as discussed previously. The proposed clean-slab-on-grade end point development methodology provides:

- A noticeably simpler, more concise picture of the PFP Transition Project end point;
- A clear goal to the PFP work force;
- Less likelihood of ambiguities and misunderstanding;
- A more effective document to market the project and gain consensus;
- A simpler way to document the derivation of the specific end points;
- Reduce the need to define specific end point closure methods;
- A clear end point obtained without the expense of the traditional end point development process;
- A more concise, understandable end point document.

XI. End Point Principles
The checklist method of end point documentation is consistent with a tailored approach to deactivation and transition planning, in which the level of detail is appropriate to the complexity and risks of the end point condition of the project.

There are several guiding principles (ground rules) that form the foundation of the end point process. These ground rules are:

- The decision to create an end point should be driven by, and clearly linked to, top tier program requirements and objectives, not by feasibility or capability. This is the central principle of the logic-based approach. End point determinations, along with allocation of resources and selection of methods should stem directly and clearly from program goals and top-tier objectives.
- The end point condition of the transitioned facility should employ defense-in-depth as a fundamental safety approach. As applied here, defense-in-depth involves three layers of protection: elimination/stabilization of hazards, effective facility containment, and facility monitoring and control.
- End point decisions are integrally linked to decisions (and constraints) on resources and methods. Cost effectiveness is important.
- A successful end point development requires ownership "buy-in" by all affected organizations including project planners, those who implement the plans, and the client and regulators. This should be an explicit part of the process.
- Work teams in the field need clear, quantitative End Points. They can't work effectively with vague or functional objectives.

The end point document will be updated to reflect the outcome of environmental documents that will be developed in the future including EE/CA and Action Memoranda decisions.

XII. End Point Methodology
The transition of the Plutonium Finishing Plant requires deactivating and dismantling PFP Complex systems and structures. The removal of accessible residual materials and equipment now will reduce radiation exposure to personnel by limiting americium in growth in the legacy plutonium holdup. The removal of these items will also take advantage of the current facility infrastructure (ventilation, trained staff, etc.). At the completion of transition activities the following will remain: foundations covered with barriers designed for exposure to the weather, below grade structures, and buried systems. This end point will significantly limit the potential for contamination migration to the environment.

The End Point Criteria Checklist method was used to define and describe the end point condition of the PFP Complex. Two checklists were developed to define the criteria for PFP transition. The first checklist addresses the
criteria for completion of facilities. The second checklist addresses the administrative requirements and documentation for completion of the transition project.

Upon approval of the criteria, the checklists will be applied to each facility identified in Table 1. This will result in facility specific end points and where required facility specific verification and signoff instructions and/or hold points. The resultant end points will be issued for implementation and will be updated and reissued after completion of the transition project as part of the administrative turnover package.

XIII. Special Provisions
Where general criteria do not fully define the requirements, building or area specific criteria are added to the general criteria. These added criteria are called special provisions. The special provisions applicable to PFP are listed below.

PFP Complex Yards & Grounds
- The end points for the PFP Complex Yards and Grounds will address all structures, systems, and grounds inside the outer PFP fence that are not addressed by specific building end points.
- Develop and issue an EE/CA to evaluate remediation alternatives for follow on PFP site disposition and final remedial actions. An Action Memorandum will be issued. Although final remediation is not part of the PFP Project, the remediation alternatives will be explored as part of the PFP Project to take advantage of process history and experienced staff prior to entering the S&M phase.

216-Z-9 Crib
The 216-Z-9 Crib will be stabilized as required to preclude release of contamination and structural collapse pending remediation of the crib. This may include application of a fixative to the walls, ceiling and exposed soil in the mining chamber. Additionally, a structural assessment will be performed of the cover slab. If structural integrity is questionable, then the crib may be backfilled or the existing cover slab reinforced. Note that remediation of the crib is beyond the scope of the PFP transition.

241-Z Waste Storage and Treatment Facility
Actions required by the RCRA Closure Plan will be completed, except for those actions that are deferred for completion under the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA). Those remaining CERCLA actions will be completed consistent with an associated CERCLA Action Memorandum following completion of the PFP Transition.

241-Z-361 Underground Waste Tank
Remediation of the Tank 241-Z-361 is beyond the scope of the PFP transition. Remediation will be managed by the Central Plateau Project. During the PFP transition will be managed like other underground waste sites at PFP with the following additions:
- An EE/CA will be performed to evaluate remediation options and an Action Memorandum will be issued.
- The structural integrity of the tank will be re-evaluated
- The high efficiency particulate air filter (HEPA) filter will be tested.

XIV. End Point Closure
On completion of an end point, a facility field representative will initially complete on the field copy of the end point document. A S&M field representative will then verify acceptable completion of the applicable activity. Verification may be performed by reviewing documents, letters, photos, work packages, work plans or by visual inspection. When all the end points for a specific area of the facility have been completed and verified, designated facility management along with S&M organization management will sign for completion and acceptance of that area. A filing system will be in place for storing the documentation closing end points and will be retained by the receiving S&M organization.

XV. Administrative End Points and Turnover Package
Administrative end points are a compilation of supporting documentation for the transfer of the PFP Complex to the S&M organization pending final site remediation. The administrative end points for the PFP Project are included in Section XVIII. The compilation includes those documents required by law, Tri-Party Agreement, DOE Orders, facility management, or the DOE.

Additional supporting documentation is included under the requirements of a turnover package. The turnover package support the physical "hands on" activities documentation required to perform future surveillances and audits and to assist in final disposition planning (i.e., "Final Radiological Surveys and Maps").

Turnover Package
The turnover package will contain, but is not limited to, the following items:
- Essential diagrams and drawings required to describe the end point condition and to support S&M and end state planning;
- Certified vendor information, if applicable;
- Chemical and hazardous substance inventory, if applicable;
- High-level deactivation and dismantlement work plans;
- Final radiological surveys and maps;
- Industrial safety hazards identified, if applicable;
- Compliance with the Hazards Communication Program, if applicable;
- Compliance with the Asbestos Control Program, if applicable;
- Compliance with the Confined Space Program, if applicable.
- Post demolition configuration drawings
- Descriptions/photos of inaccessible spaces
- Electrical distribution isolation drawings
- Structural and roof studies for below ground structures
- Fire Hazard Analysis requirements (FHA), if applicable
- Authorization basis reflecting the end point condition
- Surveillance and Maintenance Plan
- Environmental documentation to support S&M as well an EE/CA with Action Memorandum for 241-Z-361 remediation and an EE/CA and Action Memorandum for future site remediation of the PFP compound.
XVI. Contamination Control Cap Functional Goals

That portion of the slab of a contaminated or potentially contaminated structure that is exposed to the weather shall be protected to ensure contamination does not migrate. To prevent contamination from migrating, a contamination control cap will be installed over the old slab. This contamination control cap will provide a highly weather resistant contamination barrier over the old contaminated or potentially contaminated slab during the interim between dismantlement and ultimate site disposition. This interim period (surveillance and maintenance period) is assumed to be less than 20 years. This cap is not intended to meet the requirements of a RCRA cap since it serves as an interim protective measure and is not intended for final site closure.

The primary goal of the contamination control cap that is placed over the demolished building’s slab is to ensure confinement of residual contamination. Confinement is to be maintained under the following conditions for 20 years:

- Hanford’s extreme weather (-25°F to +120°F air temperature, +180°F surface temperature)
- Sunlight
- Wind and water erosion
- Water intrusion
- Icing and ice spalling/cracking/splitting
- Range fires
- Animal intrusion (including insects)
- Plant growth

Secondary goals include:

- Elimination of tripping hazards and other industrial hazards
- Runoff control (slope the cap to prevent pooling of rain water)
- Stabilizing the soil around the building (soil within a foot around the foundation is the most likely to be contaminated if there were any contamination spreads in the building)
- Minimize the maintenance required between facility dismantlement and final dispositioning of the site.
- Minor maintenance of the contamination control cap after several years is acceptable (i.e. reapplication of a concrete sealer).

Features not required from the cap:

- There is no requirement to be able to separate the contamination control cap from the existing slab. It is assumed the contamination control cap will be dispositioned as part of the slab.
- There is no maximum thickness limit, however the thickness should be kept reasonable
- There are no planned live loads beyond foot traffic.
- There is no restriction from having multiple elevations on the contamination control cap (it may be stepped and it may have local built-up areas to cover slab features, pipes, etc)
- The contamination control cap is not intended to be a RCRA cap.

One method of providing a contamination control cap would be to pour a new concrete cap (minimum 4 inches thick) over the existing slab, extending nominally 1 foot beyond the edges of the existing slab. This would meet the intent of the contamination control cap. Conceptually, this new concrete cap would have structural features similar to a good reinforced slab. It is also envisioned the new cap would be sealed with a good grade of concrete sealant. Methods other than a concrete cap may be used.

Generally, items that penetrate the old slab (such as rebar, pipes, conduits etc.) will be cut off (and plugged, if required) as close to the exposed surface of the slab as possible. Occasionally, it may be wise to encase a contaminated pipe (or other item) at an existing flange or other point a few inches above the slab. In these cases, two options exist. The first option is to increase the thickness of the contamination control cap to encase the pipe. This may be done either by increasing the thickness of the entire slab or by locally increasing the thickness. The second option is to provide an equivalent contamination barrier for the capped pipe. This could take the form of a metal cover that is placed over the item prior to pouring the concrete cap. This metal cover would need to meet the same functional goals as the contamination control cap (listed above) and the joint between the metal cover and the contamination control cap must be such that it does not create a path for contamination migration or a path for water to enter the cap and cause freeze cracking etc.
XVII. Facilities Checklist

1. Remove Special Nuclear Material (SNM) inventory from buildings.
   **Description:** PFP currently stores significant quantities of SNM in the PFP vaults. All of this material must be transferred to alternate approved storage location(s) prior to completion of the PFP transition. A walk down around the structure will be performed to verify the stored SNM has been removed.

2. Remove structures, equipment, piping, ducting etc. above the foundation/slab.
   **Description:** This end point includes activities to complete the structures’ dismantlement to the slab/foundation. A walk down will be conducted to verify removal of the structure and internal equipment (building and equipment is gone, equipment connecting building to building is gone).

3. Cleanout or remove equipment, piping, ducting etc. from accessible below-grade spaces such that the remaining equipment, piping, ducting etc. could be dispositioned as low-level waste as part of the building rubble during the final remediation of the PFP Zone. And, if needed, satisfy the end state criteria for the Central Plateau. This criteria applies to 234-5Z Tunnels, 241-Z Cells, 241-Z-RB Valve Room, 291-Z, 216-Z-9 Control Room, and 243-ZA Tank Pit.
   **Description:** This end point includes activities to complete the removal of transuranic waste (TRU) (or decontaminate to low-level waste criteria) of plutonium-contaminated equipment, piping, ducting, etc. A walk down combined with work package and radiological survey data reviews will be conducted to verify removal or decontamination to low-level waste criteria of the plutonium-contaminated equipment, piping, ducting, etc. prior to sealing the space (refer to criteria 17).

4. Isolate/seal ventilation ducting at building boundaries (foundation/slab/grade).
   **Description:** Ventilation ducting exiting the structures’ boundaries will be plugged/capped or otherwise isolated to prevent material from both entering and exiting the remaining items. A walk down of the structure will be performed to verify ducting isolation.

5. Buried piping that enters/exits a building will be flushed or allowed to drain to minimize hazardous constituents prior to capping/isolating. All recovered liquids will be dispositioned through approved methods.
   **Description:**
   - Underground drain lines and piping associated with sanitary services (water, storm drains, and sewer) will be drained. No flushing will be performed.
   - Abandoned underground drain lines and pipes to cribs, ditches, retention basins, and underground tanks (e.g. 241-Z-361 Tank, 216-Z-8 Tank, etc.) will be checked for liquids and drained, if needed, at the lowest point accessible from within buildings (e.g. lines will be checked/drained from inside 234-5Z Tunnels, 241-Z Cells, 241-Z-RB Valve Room, etc.). No flushing of these lines will be performed due to prohibitions associated with provisions of the State Waste Discharge Permit No. 4508.
   - Drain lines and pipes from process facilities to 241-Z, not associated with
Facilities Checklist

6. Isolate/seal drain lines (including floor drains) at building boundaries (foundation/slab/grade).
   Description: Process piping and drains exiting the structures' boundaries will be plugged/capped or otherwise isolated to prevent material from both entering and exiting the remaining pipe. A walk down of the structure will be performed to verify piping isolation.

7. Isolate/seal vents and penetrations to the environment.
   Description: In addition to ventilation ducting and piping, items may exit the facility boundary and require isolation. These items will be plugged/capped or otherwise isolated to prevent material from both entering and exiting the remaining items. A walk down of the structure will be performed to verify isolation.

8. Identify/label remaining tubing/piping/ducting/drain lines containing radiation/contamination.
   Description: Tubing/piping/ducting remaining after transition & dismantlement will be documented and provided to the oncoming project/contractor. Labeling will be done in accordance with approved site procedures.

9. Obtain characterization data for remaining tubing/piping/ducting/drain lines and ventilation ducting.
   Description: Characterization data will be compiled utilizing process knowledge in cases where that knowledge is likely to bound the remaining condition. When process knowledge will not bound the remaining condition, samples will be obtained with the analysis included in the data package placed in the completion package files. Process knowledge will be used to identify analytical analyses to be performed on the samples obtained.
10. Verify remaining plutonium in the below grade/buried systems (e.g. ducts, drain lines, etc.) does not pose a significant security risk nor does it pose a potential for criticality.

**Description:** This end point addresses two concerns. The first is the need to eliminate significant security risks with the second being to eliminate any potential of a criticality. To complete this end point, material will be removed or remediated as required to preclude the potential of criticality or significant security risk. Any remaining material shall be designated as waste or contamination.

11. Conduct housekeeping activities, remove and excess/dispose unattached materials and equipment.

**Description:** A walk down of the structures will be conducted prior to the seal/cover/fill being installed to verify loose materials have been removed. This end point applies to both above grade and below grade spaces.

12. Remove portable and loose equipment/piping within the structures boundary (inside the building structure but below grade).

**Description:** This end point includes activities to complete the interior stabilization and demolition (if required) of below grade spaces (e.g. 234-5Z Tunnels, and 291-Z). A walk down will be conducted to verify removal of the portable and loose internal equipment (equipment is gone, building shell and fixed equipment remains).

13. Fire extinguishers, radioactive sources from exit signs and smoke detectors, and emergency lantern batteries are removed from inside the below grade structures and reused/disposed in accordance with site procedures.

**Description:** Radioactive sources from exit signs and smoke detectors, fire extinguishers, and emergency lantern batteries contain hazardous materials and therefore are removed. A walk down is conducted to verify the removal of the previously identified items.

14. Remove/reuse/excess/dispose unused chemicals.

**Description:** This end point ensures the removal and disposition of stored chemicals. A walk down of the structure will be performed to verify stored chemicals have been removed.

15. Stabilize below grade spaces in buildings to preclude release of contamination and structural collapse thereby eliminating the need for surveillance and maintenance entries.

**Description:** This may include application of a fixative to the walls, ceiling, floors, equipment, piping, ducting, etc. as well as of any exposed soil. Additionally, a structural assessment will be performed on the cover slab. If structural integrity is questionable, then the space may be backfilled and/or the existing cover slab reinforced.
16. Remove/fix/contain radioactive contamination.
   **Description:** This end point ensures the project has mitigated the potential for contamination migration. A review of the structures’ final radiological survey report and map will be conducted to verify mitigation of contamination areas has been complete.

17. Seal structure foundation/slab (or roof in the case of 291-Z) with material having a minimum twenty-year life with minimal maintenance.
   **Description:** It is expected the remaining foundation/slab will remain for several years. A contamination control cap may be installed to inhibit the potential for radiological or hazardous material migration. In the case of 291-Z, 234-5Z, and 216-Z-9 this includes sealing below-grade access doors and backfilling the stairwells and applying a contamination control cap over the stairwells at grade level. When finished, entry to below-grade spaces will be impossible.

19. Perform radiological survey and post radiological conditions in accordance with site radiological requirements.
   **Description:** A walk down will be conducted with the final radiological survey to verify postings are in compliance with site procedures.

20. Remove/dispose of non-hazardous, radioactive, hazardous, and mixed waste in accordance with approved waste handling procedures and regulatory requirements.
   **Description:** A final review of waste handling and disposal paperwork will be conducted to validate compliance.

21. Slab is labeled/posted for radiological conditions (dose/contamination) and industrial hazards in accordance with approved site procedures.
   **Description:** After the structures’ end point condition is met, cognizant personnel will perform an audit to verify site required postings are in place. This audit may be conducted to verify there are not any postings if none are required.
In addition to the 21 criteria above, the following apply to the PFP Complex:

22. Remove miscellaneous above-grade structures/materials (e.g. camera towers, security monitoring systems, conex boxes, lay down yards, guard pill boxes, staging area shelter, dumpsters, etc.).
   Description: To meet the project objective, above grade structures/materials will be removed. Removal of these miscellaneous structures and materials will be verified by a PFP Complex walk down.

23. Remove the inner fence to alleviate the collection of tumbleweeds.
   Description: The exclusion area fence is a known tumbleweed accumulation point. One fence will be removed to limit the need to remove the collected tumbleweeds.

24. Post and isolate below grade systems and building foundations/slabs with subsurface void areas to prohibit vehicle traffic.
   Description: Signs will be posted over below grade voids unable to support vehicle traffic. A review of post demolition drawings will identify the locations requiring postings. A walk down will be conducted to verify proper postings are in place.

25. Isolate/seal manhole covers to prevent rain water/run off entering liquid and inhibiting personnel access to eliminate the confined space.
   Description: Manhole covers will be sealed to inhibit water intrusion. The manhole covers will be secured in place to prevent personnel access and allow removal from confined space listings.

   Description: A qualified representative will walk down the PFP Complex and document compliance with site confined space requirements.

27. Document compliance with the site asbestos program for inclusion in the transition & dismantlement completion package.
   Description: A qualified representative will walk down the PFP Complex and document compliance with site asbestos requirements.

28. Verify waste accumulation areas are eliminated.
   Description: Document that waste accumulation areas have had stored waste removed and that documentation has been submitted to reflect that waste is no longer being stored/staged in the identified areas. A copy of the paperwork reflecting the cessation of active use will be placed into the completion package files.
29. Isolate the PFP Complex electrical supply at a point minimizing electrical dead legs.
   Description: Electricity will be isolated from the PFP Complex. Electrical system modifications may be required to continue to provide power to non-PFP systems located within the complex (e.g. lift station). Isolation will be done to limit the isolation points and electrical dead legs. Drawings will be updated and work packages and essential drawings will be reviewed to verify they reflect the electrical isolation.

30. Isolate the PFP Complex water supply, at a point minimizing dead legs, and drain to the extent possible utilizing existing configuration.
   Description: Water will be isolated from the PFP Complex. Water system modifications may be required to continue to provide water to non-PFP systems located within the complex. Isolation will be done to minimize the number of isolation points and dead legs. Drawings will be updated and work package(s) and essential drawings will be reviewed to verify they reflect the water isolation.

31. Backfill the PFP Complex specific septic tanks.
   Description: Septic tanks associated with the PFP Complex will be backfilled prohibiting further use. Identified septic tanks are 2607-Z, 2607-Z1, and 2607-WA. Ownership of 2607-WB will be transferred to the landlord organization since it is associated with the mobile office trailers located outside the PFP fences and are not within the scope of this project.

32. Remove the PFP Complex specific above-grade steam lines.
   Description: Steam lines will be removed were they run above grade inside the outer PFP fence to prevent the potential insulation degradation. All loose ends of the steam line will be properly encapsulated to protect any remaining asbestos insulation. Steam lines will be properly supported to eliminate industrial hazards.

33. Remove the PFP Complex specific utility poles.
   Description: Unused/unneeded utility poles associated with only the PFP Complex will be removed and disposed.

34. Remove vegetation from radiologically contaminated areas.
   Description: Vegetation will be removed from contaminated areas and the area will be sprayed to inhibit new vegetation growth.

35. Grade soil to promote drainage away from remaining below-grade structures.
   Description: The soil shall be graded to promote drainage away from below grade structures utilizing good management practices. The distance away from the structure and slope angle will be evaluated for each below grade structure with underground ducting and other below grade structures taken into consideration.

36. Complete soil stabilization to mitigate dust/erosion.
   Description: Where structure removal or grading leaves newly exposed soil, the area will be stabilized. Review of work packages and site walk downs will be completed to verify the completion of this end point.
37. Post locations of below grade equipment (e.g. buried ducting).
   Description: Below grade equipment remaining after transition and dismantlement will be posted/documentated and provided to the oncoming project/contractor.

38. Transfer ownership of PFP WIDS Sites to the Central Plateau S&M organization.
   Description: Waste Information Data Systems (WIDS) sites associated with the PFP Complex will be transferred to the oncoming project/contractor. The WIDS sites database will be updated to reflect the condition as of transfer to the S&M phase.

39. Develop and issue an EE/CA to evaluate remediation alternatives for follow on PFP site disposition and follow-on remedial action.
   Description: Develop and issue an EE/CA to evaluate remediation alternatives for subsequent PFP site disposition and closure. An Action Memorandum will be issued by RL.

40. Transfer ownership of Tank 241-Z-361 to the Central Plateau S&M organization.
   Description: Tank 241-Z-361 will be treated like other underground waste sites at PFP. To support the S&M of the tank the following information actions will be provided to the S&M organization:
   - An EE/CA will be performed to evaluate remediation options and an Action Memorandum will be issued.
   - The structural integrity of the tank will be verified.
   - The HEPA filter(s) will be tested and shown to be compliant.

41. Provide administrative/physical controls to prevent unauthorized access to unauthorized storage of hazardous/radioactive materials.
   Description: The intent of this end point is to prevent post transition and dismantlement accumulation of materials. A single fence will remain around the PFP Complex with access gates locked. The keys will be controlled by PFP Complex personnel and subsequently transferred to the S&M organization to prevent unauthorized access.

42. Document radiological conditions in final survey report for inclusion in the transition & dismantlement completion package.
   Description: A final radiological survey will be conducted and documented in accordance with a survey plan.

43. Document remaining industrial hazards and compliance with site industrial safety requirements for inclusion in the project turnover package.
   Description: A safety representative will walk down the remaining structure and document compliance with site requirements and remaining hazards.
44. Utilizing current process knowledge and historic information, document amount and location of remaining radiological issues/hazardous substances/dangerous wastes for inclusion in the project turnover package.

   **Description:** Remaining hazardous substances/dangerous wastes will be documented and placed into the completion files. Utilization of historic knowledge of spills and process upsets will be used to develop the document.

45. Project turnover package items are provided: Final radiological surveys, work plans/packages, description/photos, modified configuration management documents, historical information, compliance documents that define the condition at completion of the project.

   **Description:** The items identified in the end point will be compiled and placed in the completion package files.
XVIII. Administrative Checklist

Admin-1. Complete/close outstanding audit findings and occurrence reports.
   Description: A review of facility and site action tracking systems and open occurrence reports will be conducted and items will be addressed and closed.

Admin-2. Document configuration management performed in accordance with site standards.
   Description: The final configuration of the PFP Complex will be reviewed against controlled drawings to verify proper incorporation of structure and utility modifications/isolations.

Admin-3. Provide essential drawings and a list of all facility drawings necessary for S&M.
   Description: This end point will be done in conjunction with the development of the draft S&M Plan. The essential drawing list will be updated to reflect the condition of the PFP Complex area at the end of the project. A separate list containing both the essential drawing and those required to support S&M.

Admin-4. Document remaining industrial hazards and compliance with industrial safety requirements.
   Description: This end point compiles the individual end points into one report reflecting the remaining industrial hazards.

Admin-5. Document compliance with confined space program.
   Description: This end point compiles the individual end points into one report reflecting the remaining confined spaces.

Admin-6. Document compliance with the asbestos program.
   Description: The post demolition condition of the PFP Complex will be assessed for compliance with the site asbestos program.

Admin-7. Document amount and location of remaining hazardous substances and/or dangerous wastes.
   Description: This end point compiles the individual end points into one report reflecting the remaining hazardous substances/dangerous wastes.

Admin-8. Complete and provide current Fire Hazards Analysis (FHA).
   Description: An FHA will be completed reflecting the end point condition of the PFP Complex.

Admin-9. Transfer facility physical property records.
   Description: The property records for the PFP Complex will be updated as the transition & dismantlement effort removes excess and or disposes of property.

   Description: The transition & dismantlement project/contractor has the historic and current knowledge of the PFP Complex. Therefore, they will develop a S&M Plan for the Surveillance and Maintenance organization. The oncoming project/contractor has the responsibility to release the S&M Plan under their document release procedures.
Administrative Checklist

   Description: The PFP Complex building emergency plan will be updated (or cancelled) to reflect the end point condition.

   Description: Procedures utilized by the transition & dismantlement project/contractor to conduct surveillance and maintenance at the end of the project will be copied and placed in the completion package files.

Admin-13. Provide identified regulatory commitments and regulatory documentation.
   Description: The transition & dismantlement project/contractor has the historic and current knowledge of the PFP Complex existing commitments and documentation. As such, the transition & dismantlement project/contractor will compile outstanding commitments and documentation to support the S&M organization to complete the commitments/documentation. These along with recently (within the last year of the project) completed commitments documentation (closure/completion letters) will be included in the completion package files.

Admin-14. Transfer classified documents to repository
   Description: All classified documents will be removed from the PFP Complex and placed in a site approved repository.

Admin-15. Verify transition and dismantlement completion package contents are complete.
   Description: This is a final review of the document log for the completion package files. This will ensure the intended documentation provided in the files have not been removed or checked out and not returned.

Admin-16. Provide existing regulatory permitting documentation.
   Description: The remaining regulatory permits and supporting documentation will be compiled and provided to the S&M organization.

Admin-17. Compile available historical data including chemical and plutonium spills, holdup, releases, and constituents associated with building processing to support final remediation.
   Description: This end point is designed to capture useful information on the remaining structures/systems that has been kept by facility personnel (i.e. engineers, health physics, operations, etc.) and is not available through other sources prior to their leaving the facility. This data will be compiled and placed in the completion package files. Documentation already maintained by the Hanford site document control system and/or libraries will be referenced only.
